VanillaICE: Hidden Markov Models for the Assessment of Chromosomal Alterations using High-throughput SNP Arrays

Robert Scharpf and Ingo Ruczinski

October 14, 2007

1 Introduction

Chromosomal DNA is characterized by variation between individuals at the level of entire chromosomes (e.g. aneuploidy in which the chromosome copy number is altered), segmental changes (including insertions, deletions, inversions, and translocations), and changes to small genomic regions (including single nucleotide polymorphisms). A variety of alterations that occur in chromosomal DNA, many of which can be detected using high density single nucleotide polymorphism (SNP) microarrays, are linked to normal variation as well as disease and therefore of particular interest. These include changes in copy number (deletions and duplications) and genotype (e.g. the occurrence of regions of homozygosity). Hidden Markov models (HMM) are particularly useful for detecting such abnormalities, modeling the spatial dependence between neighboring SNPs. Here, we extend previous approaches that utilize HMM frameworks for inference in high throughput SNP arrays by integrating copy number, genotype calls, and the corresponding measures of uncertainty when available. Using simulated and real data, we demonstrate how confidence scores control smoothing in a probabilistic framework. The goal of this vignette is to provide a simple interface for fitting HMMs and plotting functions to help visualize the predicted states alongside the experimental data.

2 Simple Usage

```
> library(VanillaICE)
```

```
> data(chromosome1)
```

```
> class(chromosome1)
```

```
> annotation(chromosome1)
```

See the documentation pages in the R package *VanillaICE* for more information about the chro-mosome1 example dataset. The vanilla HMM can be fit to both arms of this simulated chromosome as follows:

```
> copyNumberIce(chromosome1) <- FALSE
> callsIce(chromosome1) <- FALSE
> fit1 <- hmm(chromosome1)
[1] "Fitting HMM to chromosome 1"
[1] " processing p arm of sample NA06993 ..."
[1] " processing q arm of sample NA06993 ..."
```

Graphical parameters for plotting the results are easily obtained and manipulated:

```
> graph.par <- getPar(fit1)
> class(graph.par)
[1] "ParHmmSnpSet"
attr(,"package")
[1] "VanillaICE"
```

The predicted states are plotted beneath the observed data by

> plotSnp(graph.par, fit1)

NULL

See [2] for a more complete description of the simulated dataset and the features detected by this HMM.

3 Integrating Confidence Estimates (ICE)

In this section, we illustrate how one may fit an HMM that incorporates confidence esimates of the SNP-level summaries for genotype calls and copy number.

3.1 Confidence scores for genotype calls

We suggest using the CRLMM algorithm [1] for genotype calls. CRLMM (in the R package *oligo*) provides confidence scores (S_{GT}) of the genotype estimates (\widehat{GT}). From 269 HapMap samples assayed on the Affymetrix 50k Xba and Hind chips, we have a gold standard of the true genotype defined by the consensus of the HapMap centers. We use kernal based density estimates to obtain

 $f\left\{ \left. \mathbf{S}_{\widehat{\mathrm{HOM}}} \mid \widehat{\mathrm{HOM}}, \mathrm{HOM} \right. \right\}, \ f\left\{ \left. \mathbf{S}_{\widehat{\mathrm{HOM}}} \mid \widehat{\mathrm{HOM}}, \mathrm{HET} \right. \right\}, \ f\left\{ \left. \mathbf{S}_{\widehat{\mathrm{HET}}} \mid \widehat{\mathrm{HET}}, \mathrm{HOM} \right. \right\}, \quad \mathrm{and} \ f\left\{ \left. \mathbf{S}_{\widehat{\mathrm{HET}}} \mid \widehat{\mathrm{HET}}, \mathrm{HET} \right. \right\} \right. \tag{1}$

separately for the Xba and Hind 50k chips. The first term in (1), for example, denotes the density of the scores when the genotype is correctly called homozygous (\widehat{HOM}) and the true genotype is homozygous (HOM). See [2] for a more complete description of the methods. The data needed to estimate these densities is stored in the experiment data package *callsConfidence*. *callsConfidence* is available from the author's website.

3.2 Confidence scores for copy number estimates

To illustrate how standard errors of the copy number estimate could be integrated in the HMM, the R object chromosome1 contains standard errors simulated from a shifted Gamma: Gamma(1,2) + 0.3, where 1 is the shape parameter and 2 is the rate parameter. To ascertain the effect of qualitatively high confidence scores on the ICE HMM, we scaled a robust estimate of the copy number standard deviation by $\frac{1}{2}$. Similarly, to simulate less precise \widehat{CN} we scaled ϵ by 2. For more detailed information about how the data in the chromosome1 was generated, see the documentation for this object in the R package *VanillaICE*.

3.3 Fitting the ICE HMM

The results from fitting the ICE HMM to the chromosome1 data have been stored in the assay data element predictions of chromosome1. To see a table of the predicted underlying states (excluding normal segments) sorted by size (MB):

> breakpoints(chromosome1)

	sampleId	chromosome p	revious_SNP	start	la	st ne	ext_SNF
2	NA06993	1	49545039	49597810	525907	76 52	2669983
4	NA06993	1	52728046	52820181	544097	55 54	1498950
14	NA06993	1	216239917	216286002	2178728	10 217	7892177
6	NA06993	1	69838068	69854466	713427	08 71	1406383
8	NA06993	1	71474047	71826917	731743	89 73	3577300
12	NA06993	1	175700199	175726310	1767040	67 176	3800399
18	NA06993	1	241076215	241483148	2422953	22 242	2374397
10	NA06993	1	174815096	174828535	1756300	40 175	5683520
16	NA06993	1	238302668	238319943	2384178	64 238	3429864
	MB	hiddenStat	e cytobano	d numberSnp	s CHET	is.na	
2	2.992966	LO	H p33, p32.3	3 5	0 0	0	
4	1.589574	LO	H p32.3	3 4	7 0	0	
14	1.586808	deletio	n q4:	1 9	9 0	0	
6	1.488242	amplificatio	n p31.:	1 9	7 29	0	
8	1.347472	amplificatio	n p31.:	1 10	3 35	0	
12	0.977757	deletio	n q25.2	2 4	7 0	0	
18	0.812174	amplificatio	n q44	1	7 2	0	

10 0.801505	deletion	q25.2	46	0	0
16 0.097921	deletion	q43	5	0	0

To reproduce these results, one must install the Experiment Data package callsConfidence and run the command:

> library(callsConfidence)

```
> copyNumberIce(chromosome1) <- TRUE</pre>
```

```
> callsIce(chromosome1) <- TRUE</pre>
```

```
> chromosome1 <- hmm(chromosome1)</pre>
```

```
> graph.par <- getPar(chromosome1)</pre>
```

```
> plotSnp(graph.par, chromosome1)
```

NULL

Note that the ICE HMM correctly identifies the simulated normal segments in features B and C. Additionally, the ICE HMM detects the micro-amplification in region E.

4 HMM for copy number alterations

The method hmm has a different set of underlying hidden states depending on whether copy number estimates, genotype calls, or both are available. When only copy number estimates are available, the

hidden states (for autosomes) are hemizygous or homozygous deletion (one or fewer copies), normal (two copies), and amplification (three or more copies). The corresponding class is HmmSnpCopyNumberSet. To illustrate, we convert the chromosome1 example to an object of this class and fit the HMM.

```
> chr1.cn <- as(chromosome1, "HmmSnpCopyNumberSet")</pre>
> locationCopyNumber(chr1.cn) <- c(log2(1), log2(2), log2(3))</pre>
> initialStateProbability(chr1.cn) <- c((1 - 0.99)/2,</pre>
+
      0.99, (1 - 0.99)/2)
> scaleCopyNumber(chr1.cn) <- NULL</pre>
> stateNames(chr1.cn) <- c("deletion", "normal", "amplification")</pre>
> predictions(chr1.cn) <- matrix(NA, nrow(chr1.cn), ncol(chr1.cn))
> chr1.cn <- hmm(chr1.cn, verbose = TRUE)</pre>

5 HMM for loss of heterozygosity

When only genotype calls are available, the hidden states are loss and retention (ret) of heterozygosity. We define *loss* to be a sequence of homozygous SNPs longer than what we would expect to observe by chance. Note that many long stretches of homozygosity may occur as a result of a population sharing a common underlying haplotype structure; loss predictions from an HMM fit to an indvidual do not necessarily reflect the 'loss' of an allele in that individual. For illustration, we convert the chromosome1 example to an object of class HmmSnpCallSet and refit the HMM.

```
> chr1.calls <- as(chromosome1, "HmmSnpCallSet")</pre>
> stateNames(chr1.calls) <- c("loss", "ret")</pre>
> pCHOM(chr1.calls) <- c(0.999, 0.7)
> initialStateProbability(chr1.calls) <- c(1 - 0.99, 0.99)</pre>
 predictions(chr1.calls) <- matrix(NA, nrow(chr1.calls),</pre>
>
      ncol(chr1.calls))
+
> chr1.calls <- hmm(chr1.calls)</pre>
[1] "Fitting HMM to chromosome 1"
[1]
    "
        processing p arm of sample NA06993
[1]
    п
        processing q arm of sample NA06993
                                                  . . .
```

```
> breakpoints(chr1.calls)
  sampleId chromosome previous_SNP
                                        start
                                                    last
                                                          next_SNP

```

6 Classes for HMMs

More documentation about the classes can be found in the documentation for the R package *VanillaICE*. Note that the minimal SNP-level annotation required for the HMMs described here are physical position

of the SNP (stored as an integer) and the chromosome (stored as a character string). The motivation for requiring that this information be stored in the **featureData** is primarily for convenience when subsetting instances of these classes, but may be relaxed in future releases. See, for instance, the **featureData** in the **chromosome1** object:

> fvarLabels(chromosome1)

```
[1] "dbsnp_rs_id" "chrom" "physical_pos"
[4] "strand" "allele_a" "allele_b"
[7] "fragment_length" "enzyme"
```

In addition to the class HmmSnpSet that contains SNP-level summaries of genotype and copy number, we define classes for genotype-only (HmmSnpCallSet) and copy number-only datasets (HmmSnpCopyNumberSet). The parameters of the model, including the latent states, transition probabilities, and emission probabilities, are dependent on the class of data. See [2] additional details.

7 Session Information

The version number of R and packages loaded for generating the vignette were:

- R version 2.6.0 (2007-10-03), x86_64-unknown-linux-gnu
- Locale: LC_CTYPE=en_US;LC_NUMERIC=C;LC_TIME=en_US;LC_COLLATE=en_US;LC_MONETARY=en_US;LC_MESSAGES=er
- Base packages: base, datasets, graphics, grDevices, methods, stats, tools, utils
- Other packages: Biobase 1.16.0, oligoClasses 1.0.3, RColorBrewer 1.0-1, SNPchip 1.2.1, VanillaICE 1.0.2
